

Interpretable Machine Learning

Shapley Shapley Values

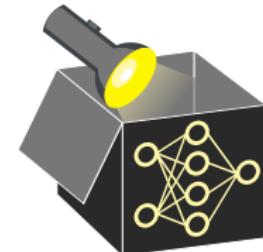

Learning goals

- Learn cooperative games and value functions
- Define the marginal contribution of a player
- Study Shapley value as a fair payout solution
- Compare order and set definitions

COOPERATIVE GAMES IN GAME THEORY

► "Shapley" 1951

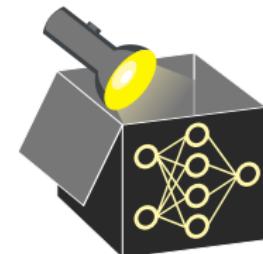

- **Game theory:** Studies strategic interactions among "players" (who act to maximize their utility), where outcomes depend on collective behavior
- **Cooperative games:** Any subset $S \subseteq P = \{1, \dots, p\}$ can form a coalition to cooperate in a game, each achieving a payout $v(S)$

COOPERATIVE GAMES IN GAME THEORY

► "Shapley" 1951

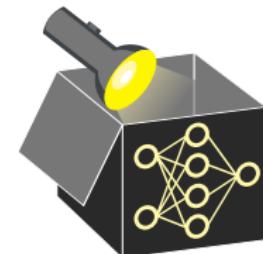

- **Game theory:** Studies strategic interactions among "players" (who act to maximize their utility), where outcomes depend on collective behavior
- **Cooperative games:** Any subset $S \subseteq P = \{1, \dots, p\}$ can form a coalition to cooperate in a game, each achieving a payout $v(S)$
- **Value function:** $v : 2^P \rightarrow \mathbb{R}$ assigns each coalition S a payout $v(S)$
 - Convention: $v(\emptyset) = 0 \rightsquigarrow$ Empty coalitions generate no gain
 - $v(P)$: Total achievable payout when all players cooperate
 \rightsquigarrow Forms the game's budget to be fairly distributed
- **Marginal contribution:** Measure how much value player j adds to coalition S by
$$\Delta(j, S) := v(S \cup \{j\}) - v(S) \quad (\text{for all } j \in P \ S \subseteq P \setminus \{j\})$$

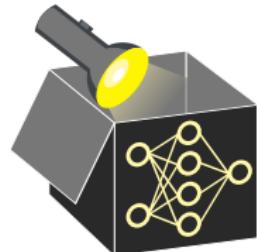

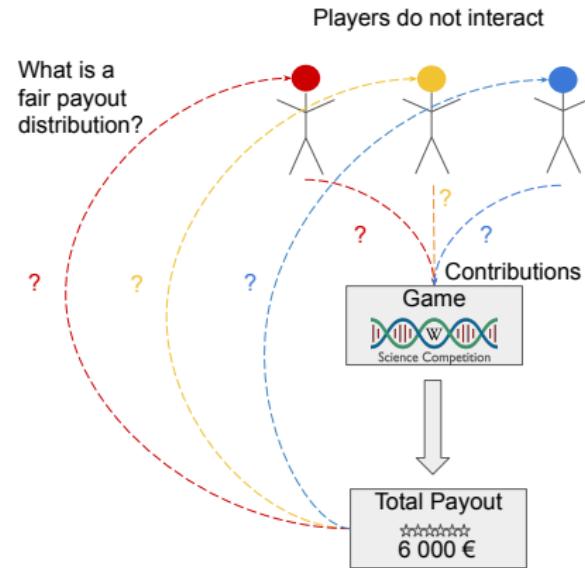

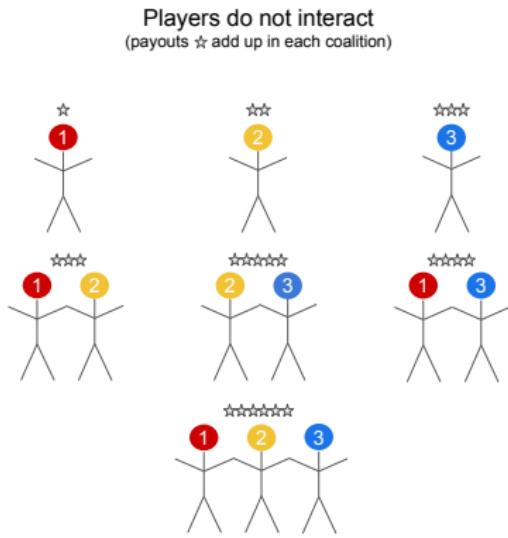

COOPERATIVE GAMES IN GAME THEORY

► "Shapley" 1951

- **Game theory:** Studies strategic interactions among "players" (who act to maximize their utility), where outcomes depend on collective behavior
- **Cooperative games:** Any subset $S \subseteq P = \{1, \dots, p\}$ can form a coalition to cooperate in a game, each achieving a payout $v(S)$
- **Value function:** $v : 2^P \rightarrow \mathbb{R}$ assigns each coalition S a payout $v(S)$
 - Convention: $v(\emptyset) = 0 \rightsquigarrow$ Empty coalitions generate no gain
 - $v(P)$: Total achievable payout when all players cooperate
 \rightsquigarrow Forms the game's budget to be fairly distributed
- **Marginal contribution:** Measure how much value player j adds to coalition S by
$$\Delta(j, S) := v(S \cup \{j\}) - v(S) \quad (\text{for all } j \in P \ S \subseteq P \setminus \{j\})$$
- **Challenge:** Players vary in their contrib. & how they influence each other
- **Goal:** Distribute $v(P)$ among players by considering player interactions
 \rightsquigarrow Assign each player $j \in P$ a fair share ϕ_j (**Shapley value**)

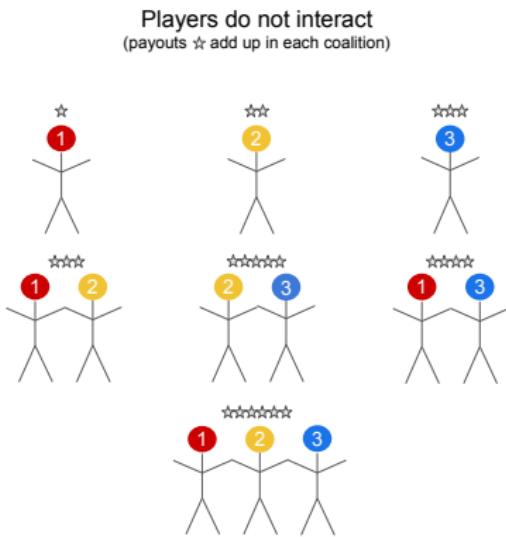

COOPERATIVE GAMES - NO INTERACTIONS

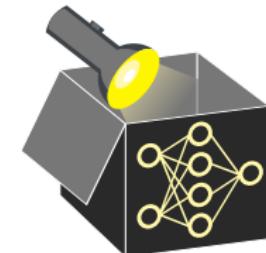

Question: What are individual marginal contributions and what's a fair payout?

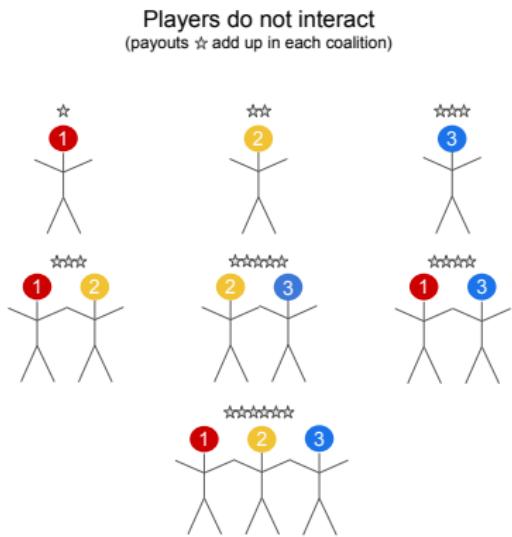

COOPERATIVE GAMES - NO INTERACTIONS

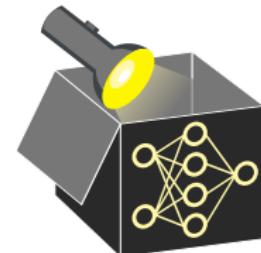

Player	Coalition S	$v(S \cup \{j\})$	$v(S)$	$\Delta(j, S)$
1	\emptyset	1000	0	1000
	{2}	3000	2000	1000
	{3}	4000	3000	1000
	{2, 3}	6000	5000	1000
2	\emptyset	2000	0	2000
	{1}	3000	1000	2000
	{3}	5000	3000	2000
	{1, 3}	6000	4000	2000
3	\emptyset	3000	0	3000
	{1}	4000	1000	3000
	{2}	5000	2000	3000
	{1, 2}	6000	3000	3000

COOPERATIVE GAMES - NO INTERACTIONS

Player	Coalition S	$v(S \cup \{j\})$	$v(S)$	$\Delta(j, S)$
1	\emptyset	1000	0	1000
1	{2}	3000	2000	1000
1	{3}	4000	3000	1000
1	{2, 3}	6000	5000	1000
2	\emptyset	2000	0	2000
2	{1}	3000	1000	2000
2	{3}	5000	3000	2000
2	{1, 3}	6000	4000	2000
3	\emptyset	3000	0	3000
3	{1}	4000	1000	3000
3	{2}	5000	2000	3000
3	{1, 2}	6000	3000	3000

- **No interactions:** Each player contrib.s same fixed value to each coalition

~~ Player 1 always adds 1000, 2 adds 2000, and 3 adds 3000

~~ Marginal contributions are constant across all coalitions S

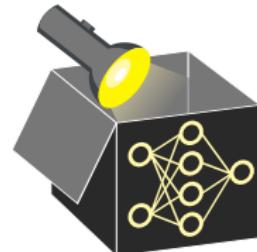

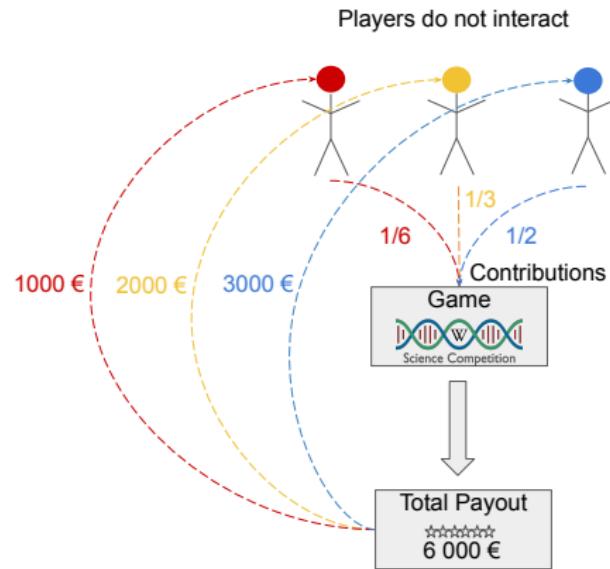

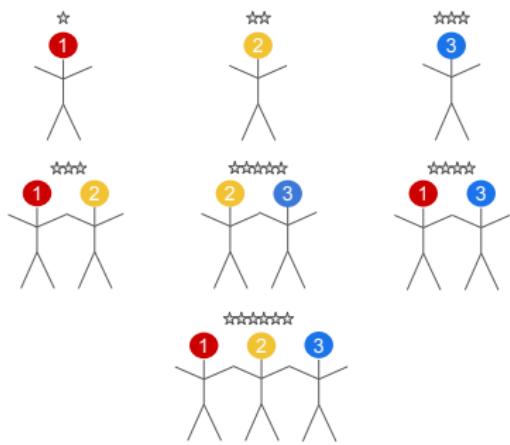

- **Conclusion:** Fair payout = average marginal contribution across all S

~~ Total value $v(P) = 6000$ splits proportionally by individual contribs:

$$1 = \frac{1}{6}, \quad 2 = \frac{1}{3}, \quad 3 = \frac{1}{2}$$

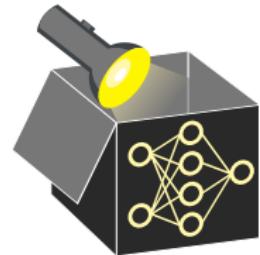

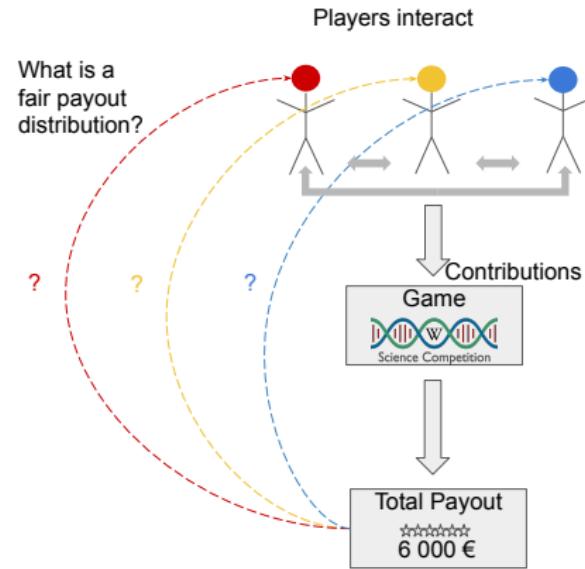

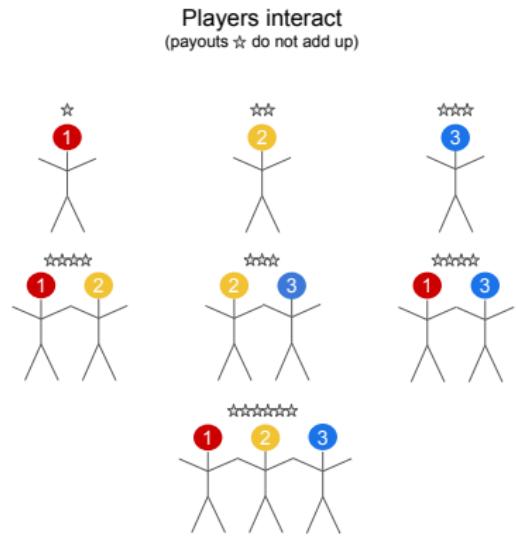

COOPERATIVE GAMES - NO INTERACTIONS

Players do not interact
(payouts ⭐ add up in each coalition)

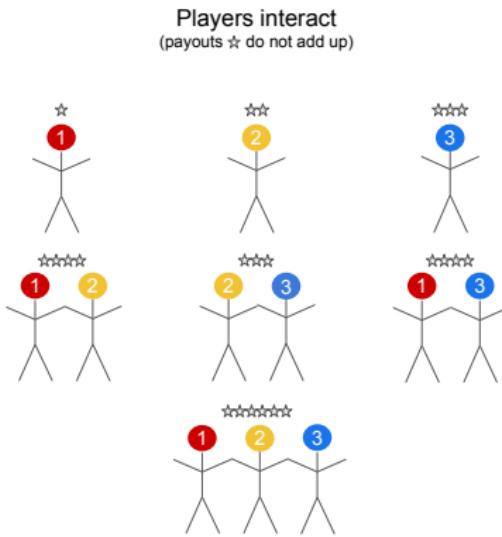

⇒ Fair payouts are trivial without interactions

COOPERATIVE GAMES - INTERACTIONS

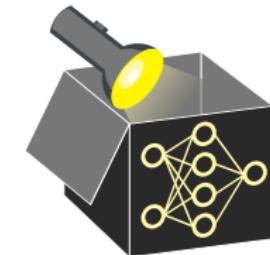

⇒ Unclear how to fairly distribute payouts when players interact

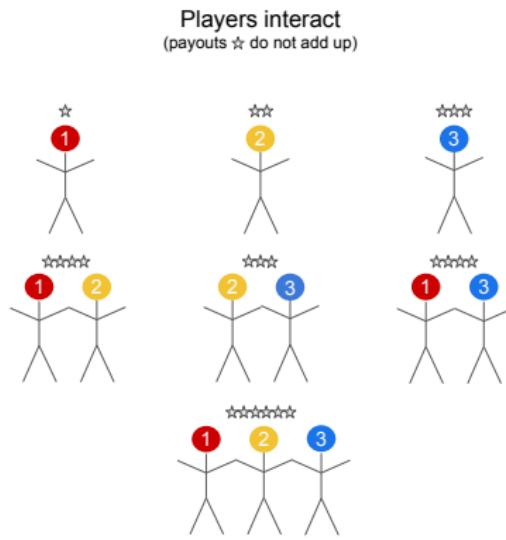

COOPERATIVE GAMES - INTERACTIONS

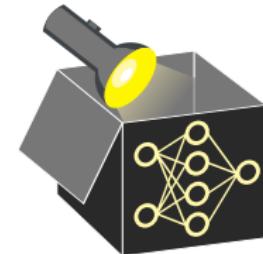

Player	Coalition S	$v(S \cup \{j\})$	$v(S)$	$\Delta(j, S)$
1	\emptyset	1000	0	1000
1	{2}	4000	2000	2000
1	{3}	4000	3000	1000
1	{2, 3}	6000	3000	3000
2	\emptyset	2000	0	2000
2	{1}	4000	1000	3000
2	{3}	3000	3000	0
2	{1, 3}	6000	4000	2000
3	\emptyset	3000	0	3000
3	{1}	4000	1000	3000
3	{2}	3000	2000	1000
3	{1, 2}	6000	4000	2000

COOPERATIVE GAMES - INTERACTIONS

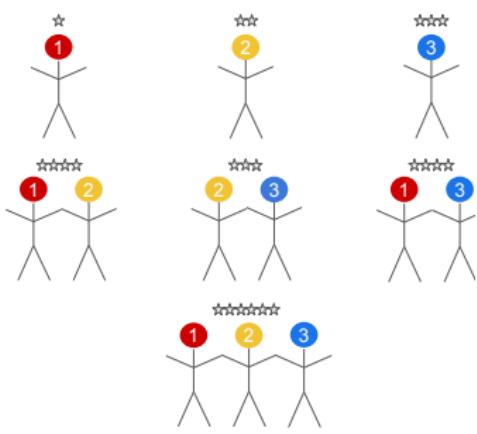

Player	Coalition S	$v(S \cup \{j\})$	$v(S)$	$\Delta(j, S)$
1	\emptyset	1000	0	1000
1	{2}	4000	2000	2000
1	{3}	4000	3000	1000
1	{2, 3}	6000	3000	3000
2	\emptyset	2000	0	2000
2	{1}	4000	1000	3000
2	{3}	3000	3000	0
2	{1, 3}	6000	4000	2000
3	\emptyset	3000	0	3000
3	{1}	4000	1000	3000
3	{2}	3000	2000	1000
3	{1, 2}	6000	4000	2000

- **With interactions:** Players contribute differently depending on coalition
 - ~~ Marginal contribs vary across coalitions S (e.g. overlap, synergy)
- Averaging over subsets does not recover total payout $v(P)$
 - ~~ unfair payout distribution
 - ~~ avg. contrib. 1 = 1750 2 = 1750 3 = 2250 don't sum to $v(P) = 6000$
- Value a player adds depends on joining order, not just who's in coalition
 - ~~ Shapley values fairly average over all possible joining orders

COOPERATIVE GAMES - INTERACTIONS

Ordering 1: ③ → ② → ①

③ joins alone: 3 ⭐

② joins: total = 3 ⭐, marginal = 0

① joins: total = 6 ⭐, marginal = +3

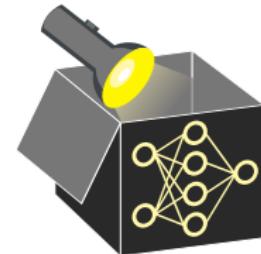

But what if ① joins before ②?

Ordering 2: ③ → ① → ②

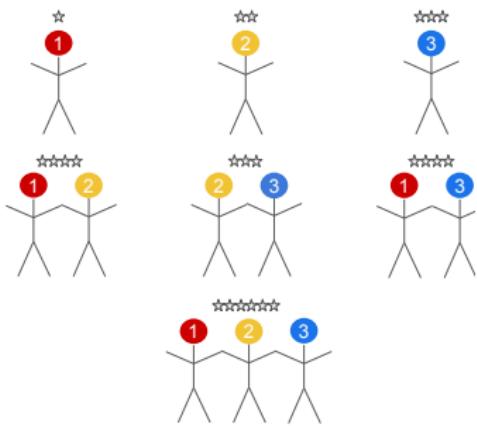

③ joins alone: 3 ⭐

① joins: total = 4 ⭐, marginal = +1

② joins: total = 6 ⭐, marginal = +2

COOPERATIVE GAMES - INTERACTIONS

Ordering 1: ③ → ② → ①

③ joins alone: 3 ⭐

② joins: total = 3 ⭐, marginal = 0

① joins: total = 6 ⭐, marginal = +3

But what if ① joins before ②?

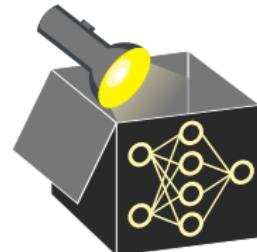

Ordering 2: ③ → ① → ②

③ joins alone: 3 ⭐

① joins: total = 4 ⭐, marginal = +1

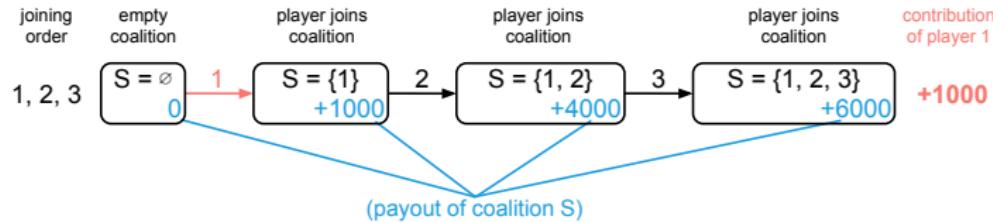

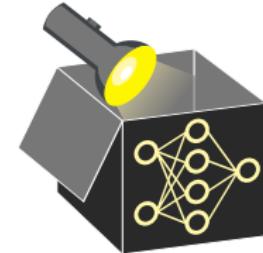

② joins: total = 6 ⭐, marginal = +2

- **Order sensitivity:** A player's marginal contribution depends on when they join S
- **Shapley value:** Averages each player's contribution over all possible join orders
 - ~~ Resolves redundancy (e.g., ③'s contribution/skill overlaps with ②'s)
 - ~~ Accounts for order sensitivity (e.g., ① brings more value if added last)
 - ~~ Ensures fairness (order of joining gives no advantage/disadvantage)

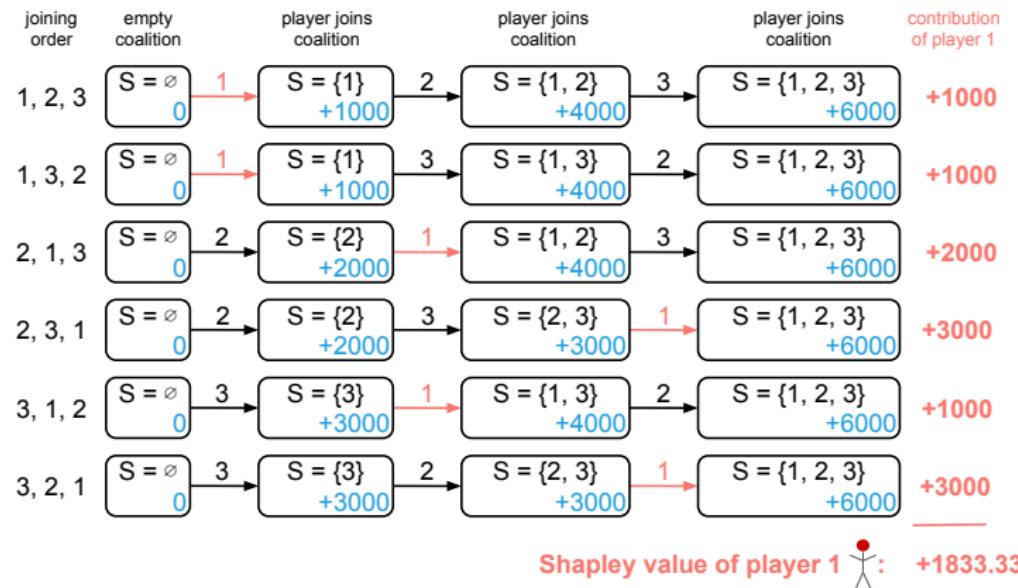

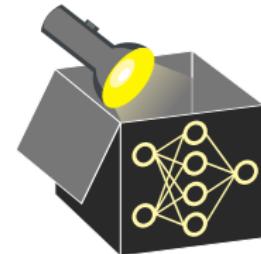

SHAPLEY VALUES - ILLUSTRATION

- Generate all possible joining orders (all permutations of full set P)
- For each order: track player j -th marginal contrib when j joins a coalition

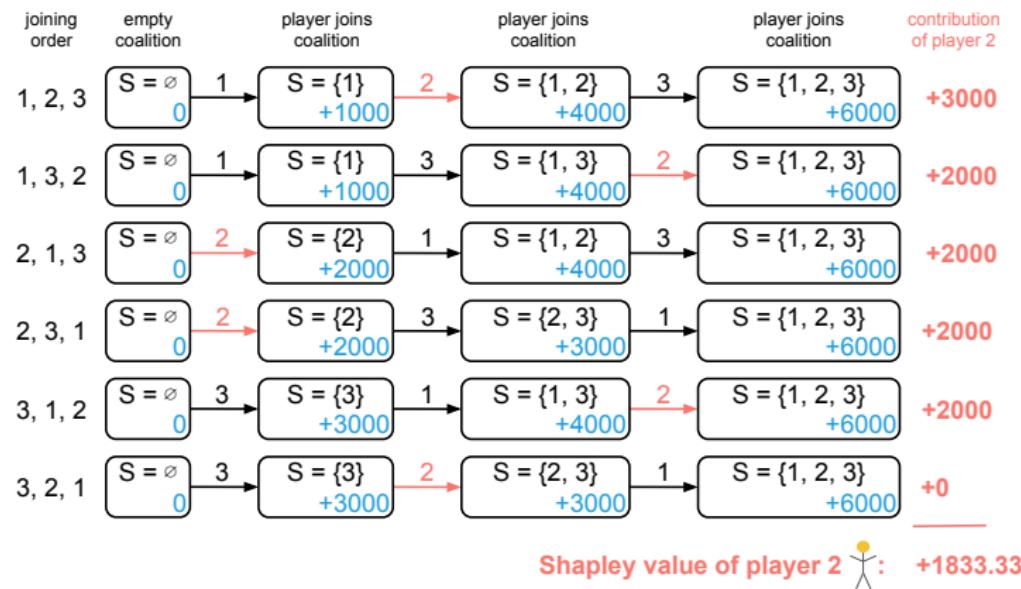

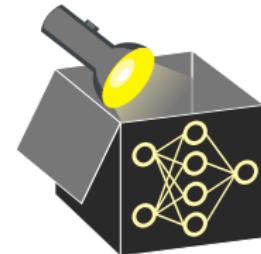

SHAPLEY VALUES - ILLUSTRATION

- Generate all possible joining orders (all permutations of full set P)
- For each order: track player j -th marginal contrib when j joins a coalition
- Shapley value of j : Average this marginal contrib over all joining orders
- **Example:** Compute payout diff. after player 1 enters coalition \rightsquigarrow average

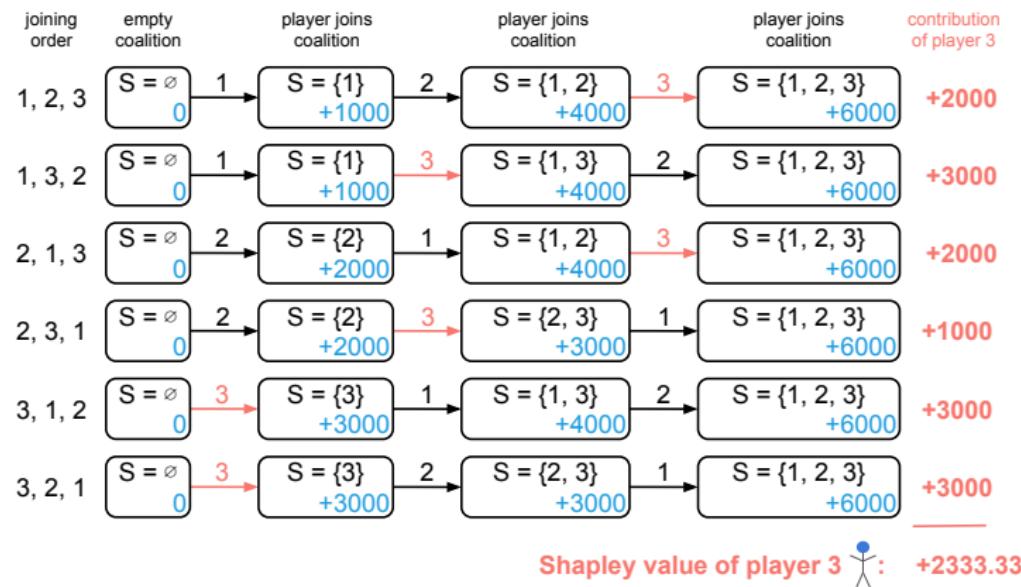

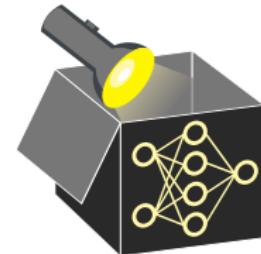

SHAPLEY VALUES - ILLUSTRATION

- Generate all possible joining orders (all permutations of full set P)
- For each order: track player j -th marginal contrib when j joins a coalition
- Shapley value of j : Average this marginal contrib over all joining orders
- **Example:** Compute payout diff. after player 2 enters coalition \rightsquigarrow average

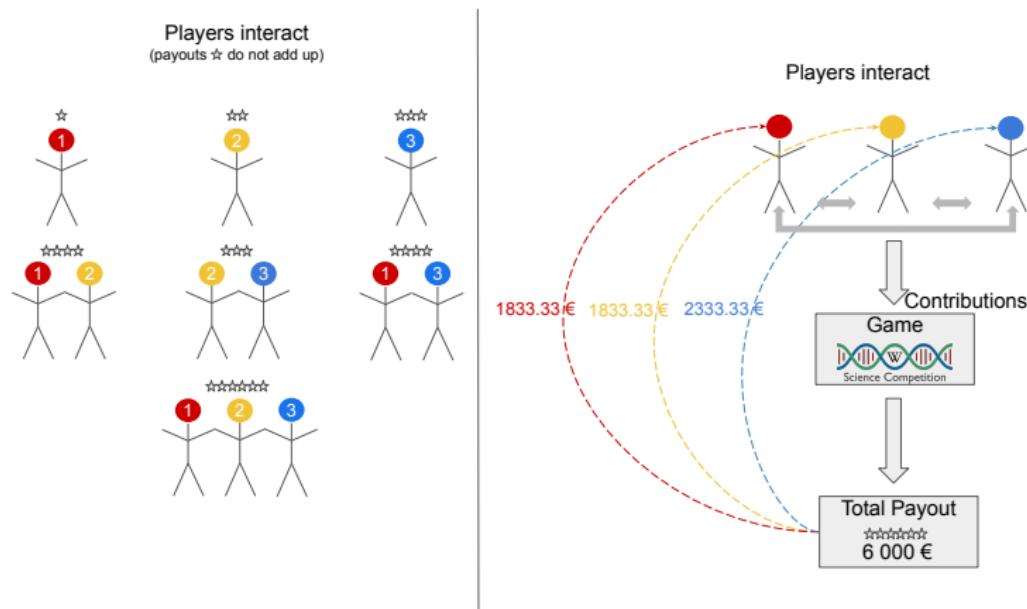

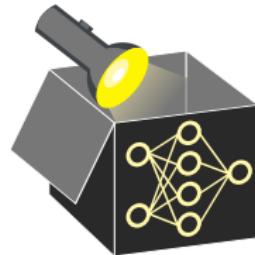

SHAPLEY VALUES - ILLUSTRATION

- Generate all possible joining orders (all permutations of full set P)
- For each order: track player j -th marginal contrib when j joins a coalition
- Shapley value of j : Average this marginal contrib over all joining orders
- **Example:** Compute payout diff. after player 3 enters coalition \rightsquigarrow average

SHAPLEY VALUES - ILLUSTRATION

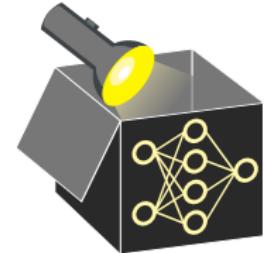

- Generate all possible joining orders (all permutations of full set P)
- For each order: track player j -th marginal contrib when j joins a coalition
- Shapley value of j : Average this marginal contrib over all joining orders

SHAPLEY VALUE - ORDER DEFINITION

The **Shapley value order definition** averages the marginal contribution of a player across all possible player orderings:

$$\phi_j = \frac{1}{|P|!} \sum_{\tau \in \Pi} (v(S_j^\tau \cup \{j\}) - v(S_j^\tau))$$

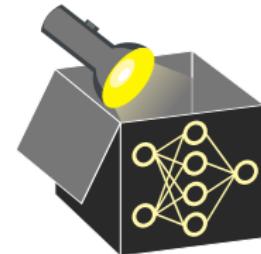

- Π : Set of all permutations (joining orders) of the players – $|P|!$ in total

SHAPLEY VALUE - ORDER DEFINITION

The **Shapley value order definition** averages the marginal contribution of a player across all possible player orderings:

$$\phi_j = \frac{1}{|P|!} \sum_{\tau \in \Pi} (v(S_j^\tau \cup \{j\}) - v(S_j^\tau))$$

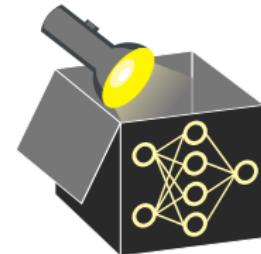

- Π : Set of all permutations (joining orders) of the players – $|P|!$ in total
- S_j^τ : Set of players before j joins, for each ordering $\tau = (\tau^{(1)}, \dots, \tau^{(p)})$
E.g.: $\Pi = \{(\textcolor{red}{1}, \textcolor{blue}{2}, \textcolor{orange}{3}), (\textcolor{red}{1}, \textcolor{orange}{3}, \textcolor{blue}{2}), (\textcolor{blue}{2}, \textcolor{red}{1}, \textcolor{orange}{3}), (\textcolor{blue}{2}, \textcolor{orange}{3}, \textcolor{red}{1}), (\textcolor{orange}{3}, \textcolor{red}{1}, \textcolor{blue}{2}), (\textcolor{orange}{3}, \textcolor{blue}{2}, \textcolor{red}{1})\}$
 - ~~ For joining order $\tau = (\textcolor{blue}{2}, \textcolor{red}{1}, \textcolor{orange}{3})$ and player $j = \textcolor{blue}{3} \Rightarrow S_j^\tau = \{\textcolor{blue}{2}, \textcolor{red}{1}\}$
 - ~~ For joining order $\tau = (\textcolor{orange}{3}, \textcolor{red}{1}, \textcolor{blue}{2})$ and player $j = \textcolor{red}{1} \Rightarrow S_j^\tau = \{\textcolor{orange}{3}\}$

SHAPLEY VALUE - ORDER DEFINITION

The **Shapley value order definition** averages the marginal contribution of a player across all possible player orderings:

$$\phi_j = \frac{1}{|P|!} \sum_{\tau \in \Pi} (v(S_j^\tau \cup \{j\}) - v(S_j^\tau))$$

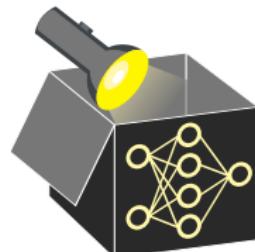

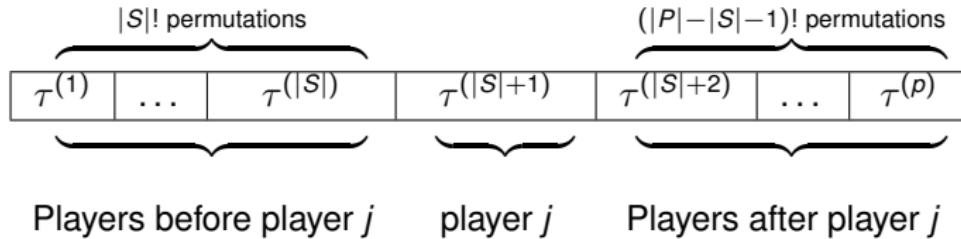

- Π : Set of all permutations (joining orders) of the players – $|P|!$ in total
- S_j^τ : Set of players before j joins, for each ordering $\tau = (\tau^{(1)}, \dots, \tau^{(p)})$
 - E.g.: $\Pi = \{(1, 2, 3), (1, 3, 2), (2, 1, 3), (2, 3, 1), (3, 1, 2), (3, 2, 1)\}$
 - ~ For joining order $\tau = (2, 1, 3)$ and player $j = 3 \Rightarrow S_j^\tau = \{2\}$
 - ~ For joining order $\tau = (3, 1, 2)$ and player $j = 1 \Rightarrow S_j^\tau = \{3\}$
- Order definition allows to approximate Shapley values by sampling permutations
 - ~ Sample a fixed $M \ll |P|!$ random permutations and average:

$$\phi_j \approx \frac{1}{M} \sum_{\tau \in \Pi_M} (v(S_j^\tau \cup \{j\}) - v(S_j^\tau))$$

where $\Pi_M \subset \Pi$ is the random sample of M player orderings

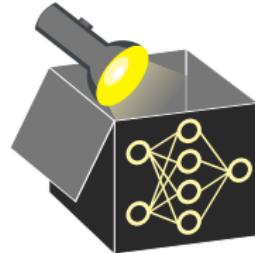

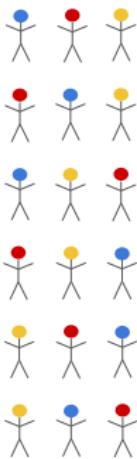

FROM ORDER DEFINITION TO SET DEFINITION

- **Note:** The same subset S_j^{τ} can occur in multiple permutations
~~ Its marginal contribution is included multiple times in the sum in ϕ_j
- **Example** Π (for players $P = \{1, 2, 3\}$, player of interest $j = 3$):
 $\{(1, 2, 3), (1, 3, 2), (\underline{2, 1, 3}), (2, 3, 1), (3, 1, 2), (3, 2, 1)\}$
~~ In $(1, 2, 3)$ and $(2, 1, 3)$, player 3 joins after coal. $S_j^{\tau} = \{1, 2\}$
⇒ Marginal contribution $v(\{1, 2, 3\}) - v(\{1, 2\})$ occurs twice in ϕ_j
- **Reason:** Each subset S appears in $|S|!(|P| - |S| - 1)!$ orderings before j joins
⇒ There are $|S|!$ possible orders of players within coalition S
⇒ There are $(|P| - |S| - 1)!$ possible orders of players without S and j

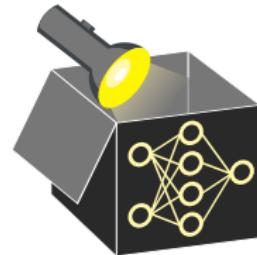

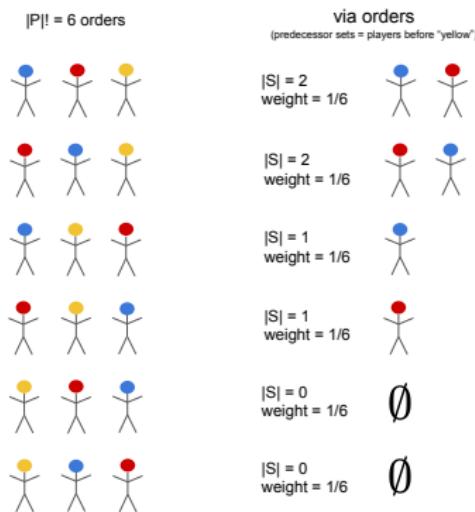

FROM ORDER DEFINITION TO SET DEFINITION

$|P|! = 6$ orders

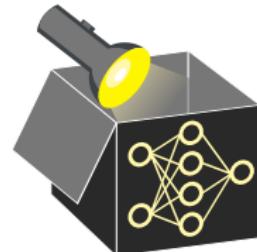

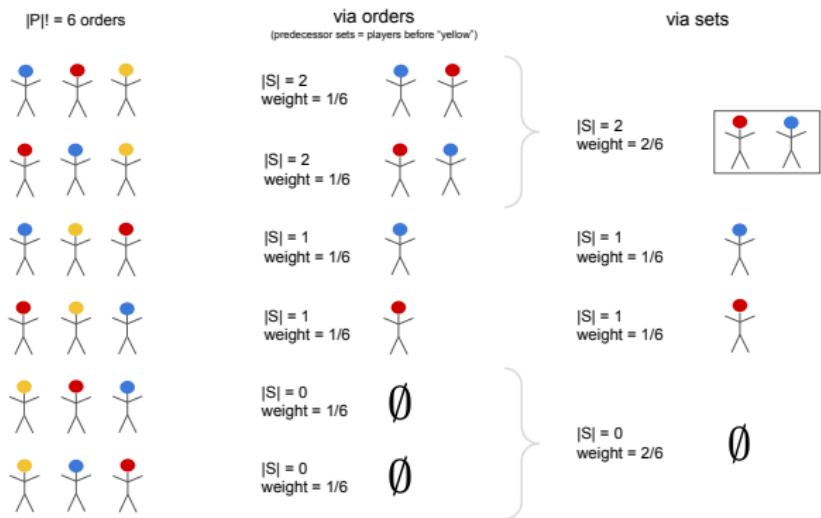

- **Order view:** Each of the $|P|!$ permutes contributes 1 term with weight $\frac{1}{|P|!}$
- Same subset $S \subseteq P \setminus \{j\}$ can appear before j in multiple orders
~~ e.g., $S = \{\bullet\text{Blue}, \bullet\text{Red}\} = \{\bullet\text{Red}, \bullet\text{Blue}\}$
- **Set view:** Group by unique subsets S , not permutations
- Each S occurs in $|S|!(|P| - |S| - 1)!$ orderings ~~ Weight: $\frac{|S|!(|P| - |S| - 1)!}{|P|!}$

FROM ORDER DEFINITION TO SET DEFINITION

- **Order view:** Each of the $|P|!$ permutes contributes 1 term with weight $\frac{1}{|P|!}$
- Same subset $S \subseteq P \setminus \{j\}$ can appear before j in multiple orders
~~ e.g., $S = \{\bullet\text{blue}, \bullet\text{red}\} = \{\bullet\text{red}, \bullet\text{blue}\}$
- **Set view:** Group by unique subsets S , not permutations
- Each S occurs in $|S|!(|P| - |S| - 1)!$ orderings ~~ Weight: $\frac{|S|!(|P| - |S| - 1)!}{|P|!}$

FROM ORDER DEFINITION TO SET DEFINITION

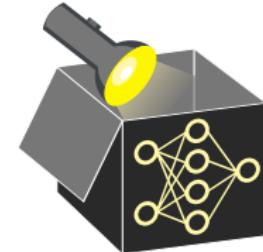

- **Order view:** Each of the $|P|!$ permutes contributes 1 term with weight $\frac{1}{|P|!}$
- Same subset $S \subseteq P \setminus \{j\}$ can appear before j in multiple orders
~~ e.g., $S = \{\bullet\text{blue}, \bullet\text{red}\} = \{\bullet\text{red}, \bullet\text{blue}\}$
- **Set view:** Group by unique subsets S , not permutations
- Each S occurs in $|S|!(|P| - |S| - 1)!$ orderings ~~ Weight: $\frac{|S|!(|P| - |S| - 1)!}{|P|!}$

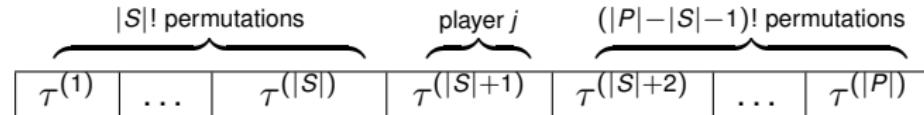

SHAPLEY VALUE - SET DEFINITION

Shapley value via **set definition** (weighting via multinomial coefficient):

$$\phi_j = \sum_{S \subseteq P \setminus \{j\}} \frac{|S|!(|P| - |S| - 1)!}{|P|!} (v(S \cup \{j\}) - v(S))$$

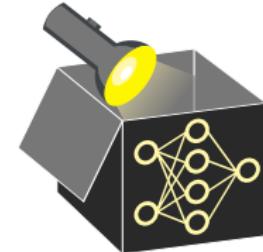

The coefficient gives the probability that, when randomly arranging all $|P|$ players, the exact set S appears before player j , and the remaining players appear afterward.

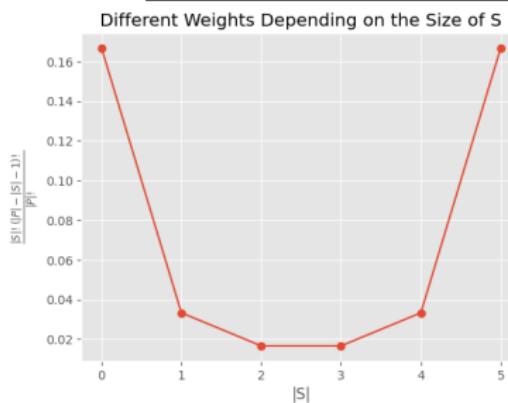

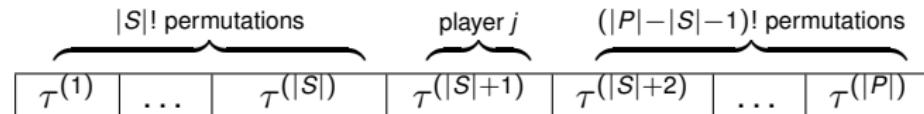

SHAPLEY VALUE - SET DEFINITION

Shapley value via **set definition** (weighting via multinomial coefficient):

$$\phi_j = \sum_{S \subseteq P \setminus \{j\}} \frac{|S|!(|P| - |S| - 1)!}{|P|!} (v(S \cup \{j\}) - v(S))$$

The coefficient gives the probability that, when randomly arranging all $|P|$ players, the exact set S appears before player j , and the remaining players appear afterward.

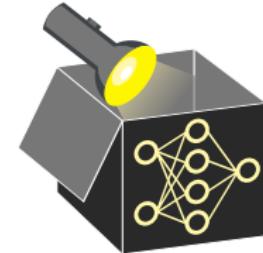

- $|S| = 0$: player j joins first
⇒ many permutations ⇒ high weight
- $|S| = |P| - 1$: player j joins last
⇒ many permutations ⇒ high weight
- Middle-sized $|S|$: fewer exact matches
⇒ lower weight
- Result: U-shaped weight distribution

AXIOMS OF FAIR PAYOUTS

What makes a payout fair? The Shapley value provides a fair payout ϕ_j for each player $j \in P$ and uniquely satisfies the following axioms for any value function v :

- **Efficiency:** Total payout $v(P)$ is fully allocated to players:

$$\sum_{j \in P} \phi_j = v(P)$$

AXIOMS OF FAIR PAYOUTS

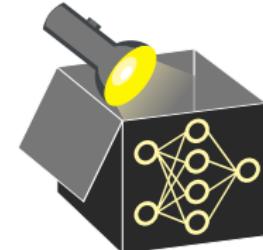

What makes a payout fair? The Shapley value provides a fair payout ϕ_j for each player $j \in P$ and uniquely satisfies the following axioms for any value function v :

- **Efficiency:** Total payout $v(P)$ is fully allocated to players:

$$\sum_{j \in P} \phi_j = v(P)$$

- **Symmetry:** Indistinguishable players $j, k \in P$ receive equal shares:

If $v(S \cup \{j\}) = v(S \cup \{k\})$ for all $S \subseteq P \setminus \{j, k\}$, then $\phi_j = \phi_k$

AXIOMS OF FAIR PAYOUTS

What makes a payout fair? The Shapley value provides a fair payout ϕ_j for each player $j \in P$ and uniquely satisfies the following axioms for any value function v :

- **Efficiency:** Total payout $v(P)$ is fully allocated to players:

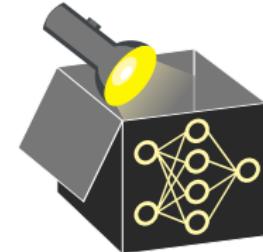

$$\sum_{j \in P} \phi_j = v(P)$$

- **Symmetry:** Indistinguishable players $j, k \in P$ receive equal shares:

If $v(S \cup \{j\}) = v(S \cup \{k\})$ for all $S \subseteq P \setminus \{j, k\}$, then $\phi_j = \phi_k$

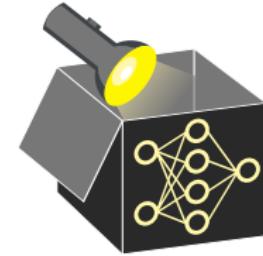

- **Null Player (Dummy):** Players who contribute nothing receive nothing:

If $v(S \cup \{j\}) = v(S)$ for all $S \subseteq P \setminus \{j\}$, then $\phi_j = 0$

AXIOMS OF FAIR PAYOUTS

What makes a payout fair? The Shapley value provides a fair payout ϕ_j for each player $j \in P$ and uniquely satisfies the following axioms for any value function v :

- **Efficiency:** Total payout $v(P)$ is fully allocated to players:

$$\sum_{j \in P} \phi_j = v(P)$$

- **Symmetry:** Indistinguishable players $j, k \in P$ receive equal shares:

If $v(S \cup \{j\}) = v(S \cup \{k\})$ for all $S \subseteq P \setminus \{j, k\}$, then $\phi_j = \phi_k$

- **Null Player (Dummy):** Players who contribute nothing receive nothing:

If $v(S \cup \{j\}) = v(S)$ for all $S \subseteq P \setminus \{j\}$, then $\phi_j = 0$

- **Additivity:** For two separate games with value functions v_1, v_2 , define a combined game with $v(S) = v_1(S) + v_2(S)$ for all $S \subseteq P$. Then:

$$\phi_{j, v_1 + v_2} = \phi_{j, v_1} + \phi_{j, v_2}$$

~~~ Payout of combined game = payout of the two separate games
